

Dual-view radar detector with a conditional Transformer decoder

Architecture study inspired by pyramid-token fusion and RADE-style radar diagrams · conceptual only

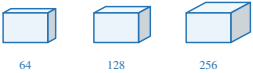

PROPOSED CONCEPT · NOT CURRENT IMPLEMENTATION

2.5-D drawing convention

front face = spatial feature map

depth = channels · perspective is illustrative · no 3-D convolution

Concept boundary and provenance

Proposed adaptation: Zhang et al. (2026), pyramid-token fusion + conditional Transformer decoder; RADE-Net-inspired visual language.

This is not the current model7 implementation. One-to-one Hungarian assignment is assumed; token count and embedding width remain design choices.
